

The Trust Product Family

TrustVault

Secure mobile access to internal file repositories at VS-NfD level

The Trust Product Family

indigo (iOS Native Devices in Government Operation) is a solution approved by the German Federal Office for Information Security (BSI) specifically for government authorities to handle data classified as VS-NfD on iPhones and iPads. It includes basic communication and collaboration functions such as email, contacts, and calendars.

Materna Virtual Solution provides comprehensive expertise to extend these basic functions. We specialize in highly secure, ultra-mobile communication for government authorities, with particular expertise in approved iOS applications. We are familiar with the framework conditions, guidelines, and requirements for developing indigo apps and extend indigo with useful applications for secure, ultra-mobile working. TrustVault is the next app designed to facilitate secure mobile working.

What is TrustVault?

TrustVault enables secure mobile access to internal file repositories, consistently at VS-NfD level. Employees of government authorities can manage files stored on protected drives from any location and share them in a controlled manner. All use takes place within the secure indigo environment, ensuring that official and private data remain clearly separated.

For example, operational, meeting, or case-related documents can be viewed and updated while on the move and then synchronized directly with the central file repository. Data recorded on site, such as during inspections or technical operations, can also be made immediately available to office-based staff for further processing.

Seamless integration with other indigo apps such as TrustDok creates a consistent and efficient workflow across applications. Files stored in TrustVault can be securely shared with other managed applications within the indigo environment.

Collaboration always takes place through central access to internal file repositories, without disruptions between systems or uncontrolled copies of data.

Features

- + Secure access to internal file repositories via SMB or WebDAV
- + Copy, duplicate, move, rename, or delete files and folders
- + Share documents via the Files app and the "Open in" function
- + Create folders and customize the folder structure
- + Search and sorting functions
- + Favorite files and folders

Benefits

- + Extends the basic functions of the indigo environment
- + Enables mobile editing and sharing of files classified as VS-NfD
- + Seamless integration into the indigo working environment
